Mongo DB Resize

There are a couple of Mongo Databases that are created from a terraform module

At times these databases can run out of space

NEVER try to use the module in its current form to expand the disks

The result will be, is that the instances get wiped out and recreated empty including the snapshots

To resize Mongo DB

1- First resize with "gcloud compute disk resize" or using the GCP cloud console

2- Once the resize has taken place, update the terraform to match. (deploy/mongodb-instances.tf)
